This course in detection, diagnosis and therapy of Alzheimer's disease and for drug screening

This course in detection, diagnosis and therapy of Alzheimer's disease and for drug screening

Disclosure; Page 197-199; 238pp; English.

This cDNA clone for a murine presentlin-1 (PSI) homologue (see W13966). It was isolated from a mouse cDNA library using a DNA probe from the human PSI gene (see V04666). Mutations in the human PSI and PSZ genes (see V04666.08) have been linked to the cavelopment in humans of forms of familial Alzheimer's disease (FAD). All amino acids that are mutated in analysed FAD pedigrees were conserved in the murine homologue. Use of the nucleic acids and proteins comprising or derived from presentlins can be made in screening and diagnosing FAD, identifying and developing therapeutics for treatment of FAD, and in producing cell lines and transgenic animals useful as models of FAD.

Preparation of the presention peptide PSI/429 and its analogues - useful for diagnosis and treatment of Alzheimer's disease

PS Disclosure; Fig 2; 77pp; English.

This sequence encodes the PSI/467 presention peptide. This sequence is specifically stated as not being in the nucleic acid of the invention, which encodes the PSI/429 presention peptide PSI/429 (II): Cells transformed with the DNA are used to produce recombinant (II) and analogues, useful e.g. as immunogens for generating an immune response cagainst PSI/429. (II) is a new product of the PSI/429 (II): Cells which cause Alzheimer's disease (AD). The nucleic acids are generally cuseful as probes for detection and quantification of PSI/429, can also be used to relate the protein level using Ab as immunoassay reagents. Or buridise with probes are isolated for sequencing. Antibodies (Ab) can also be diagnosed at the protein level using Ab as immunoassay reagents. Or the PSI/429 gene used to identify epitopes and for affinity purification of the PSI/429 gene or polypeptide caids and peptides are useful as mindles are used as models for AD, e.g. for testing drugs. Regulators of the PSI/429 gene or polypeptide can be used to treat e.g. AD or diseases (Involving mitochondrial pathology, apoptosis and neurodegeneration. Typical regulators are antisense sequences, ribozymes, aptamers, con synthetic or natural compounds. (II) may also be used to target other coding sequences to particular cellular locations.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       PS1/467 protein coding séquence.

Products for use in detection, diagnosis and therapy of Alzheimer's products for use in detection, diagnosis and therapy of Alzheimer's products for use in detection, diagnosis and therapy of Alzheimer's disease and for drug screening

This cDNA clone, deposited as ATCC 97124, codes for human

This cDNA clone, deposited as ATCC 97124, codes for human

This cDNA clone, deposited as ATCC 97124, codes for human

This cDNA clone, deposited as ATCC 97124, codes for human

This cDNA clone, deposited as ATCC 97124, codes for man is a large of the ALZ for derived from been linked to the development in humans of forms of familial

Alzheimer's disease (FAD) and may be causative of other disorders,

G. contitive, intellectual, neurological or physiological

disorders such as cerebral haemorrhage, schizophrenia, depression,

mental retardation and epilepsy. Isolation of the hESI cDNA

followed genetic mapping of the AD3 region at 14024.3, construction

of a physical contig spanning the AD3 region, transcription mapping

and analysis of candidate genes, and recovery of candidate genes by

RT-PCR from brain mRNA. In this cDNA, exon 1 is spliced directly

of a construction of the mRNA transcription mapping

and analysis of the mRNA transcript. A mouse PSI homologue

(see V04668) and a human presentilin-2 sequences for hPSI (see

Typ661-71). Use of the nucleic acids and proteins comprising or

therracting proteins and transgenic animals useful as models

of FAD, identifying and developing therapeutics for treatment of FAD,

characting proteins are also provided.

         purpose. Vectors containing or expressing a nucleic acid molecule, protein or antibody specific for mutant PSI can be administered to a patient to reduce the likelihood, or delay the onset, of Alzheimer's disease, e.g. anti-sense RNA expression can be used to decrease expression of the PSI peptide. Transgenic animals expressing the Alzheimer's disease protein can be used to test candidate therapeutics and to investigate the normal role of PSI. The PSI peptide may also be included in pharmaceutical compositions (vaccines) for Alzheimer's disease therapy.
Antibodies against the mutant polypeptide can also be used for this
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ServalargPheTyrThrGluLysAsnGlyGlnLeuIleTyrThrProPh 124

Claim 1; Fig 1; 44Pp; English.
A full-length cDNA (T59535) of the early onset Alzheimer's disease
(EOAD) gene sequence codes for a 467-amino acid polypeptide (W11839)
Another full-length cDNA (T59536) of an EOAD splice variant gene codes for a 463-amino acid polypeptide (W11840). The 2 sequences can be used to generate primers and probes for the diagnosis of predisposition to Alzheimer's disease, esp. EOAD. They can also be used for prodn. of EOAD polypeptides in transformed host cells, and antisease sequences can be used for the treatment of EOAD.
Sequence 1762 BP; 442 A; 389 C; 430 G; 478 T;
                                                                                        07-MAY-1997 (first entry)

Human early onset Alzheimer's disease (EOAD) gene.

Early onset Alzheimer's disease; EOAD; neurodegenerative disease; diagnosis; gene therapy; antisense; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              277 GGCAGGAGCACAACGACGAGCCTTGGCCACCCTGAGCCATATCT 326

/note-"Organ: lung; Vector: pT7T3D-Pac (Pharmacia) with a modified polylinker; 1st strand cDNA was prepared from pooled lung tumor tissue, and was then primed with a Not I pooled lung tumor tissue, and was then primed with a Not I Eco RI adaptors (Pharmacia), digested with Not I and cloned into the Not I and Eco RI sites of the modified pT7T3 vector. Library went through one round of pT7T3 vector. Library went through one round of Fatima Bonaldo.

/note="Organ: brain; Vector: pT7T3D-Pac (Pharmacia) with a modified polylinker; its strand cDNA was prepared from medulloblastoma tumor tissue, and was then primed with a Not I - oligo(dT) primer. Double-stranded cDNA was ligated to Eco RI adaptors (Pharmacia), digested with Not I and cloned into the Not I and Eco RI sites of the modified pT7T3 vector. This library is normalized. Library pronstructed by Bento Soares and M. Fatima Bonaldo."

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    /note="Organ: Kidney; Vector: pT7T3D-Pac (Pharmacia) with a modified polylinker; Site_1: Not I; Site_2: Eco RI; Plasmid DNA from the normalized library NCI_CGAP_Kid3 was prepared, so circles were made in vitro. Following HAP purification, this DNA was used as tracer in a subtractive hybridization reaction. The driver was PCR-amplified cDNAs from a pool of 5,000 clones made from the same library (clonelDS 1322376-1323911, 1456007-1456775, and 1500552-1502855). Subtraction by Bento Soares and M. Fatima Bonaldo.

New isolated mutant presentiin-1 genes - useful for developing products for use in detection, diagnosis and therapy of Alzheimer's disease and for drug screening

"I disease and for drug screening
"I disease and for drug screening
"I claim 19; Page 203-204; 238pp; English.
"This polypeptide comprises human presentlin-2 (hPS2). Its amino and sequence was deduced from an isolated cDNA clone (see V04669). Human and mutine presentlin-1 sequences are also provided (see W23964-66). Mutations in the PS-1 and PS-2 genes are linked to the development in humans of forms of familial Alzheimer's disease (FAD) and may be causative of other disorders, e.g. cognitive, intellectual, neurological or physiological disorders such as crebral haemorrhage, schizophrenia, depression, mental retardation and epilepsy. Use of the nucleic acids and proteins comprising or derived from the presentlins is made in screening and diagnosing FAD, identifying and developing therapeutics for treatment of FAD, complishing cell lines and transgenic animals useful as models of FAD. Methods for identifying substances that bind to, or modulate the activity of a presentlin protein, and methods for presently in witherapetin with a presently protein with protein with protein with a presently in the presently or a presently in the presently or a pre
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            presentiin interacting protein with a presentlin protein are also

New presention genes - useful for diagnosis, therapy and drug
PT screening of familial Alzheimer's disease, cerebral disorders, etc.
Claim 4: 178pp. English.
CC Mighly conserved integral membrane proteins with a common structural
CC fighly conserved integral membrane proteins with a common structural
CC fighly conserved integral membrane proteins with a common structural
CC fighly conserved integral membrane proteins with a common structural
CC fighly conserved integral membrane proteins with a common structural
CC disease (AD) and possibly other diseases such as cerebral haemorrhage,
CC disease (AD) and possibly other diseases such as cerebral haemorrhage,
CC diseases. The wild type sequences can be used for diagnosis of these
CC diseases. The wild type proteins, or vectors that express them or
CC containing antisense sequences, antibodies selective for these mutant
CC forms of the proteins and modulators of PS gene expression are
CC optentially useful for treatment of AD etc. Transgenic animals are useful
CC affinity purification and in immunoassays.
SQ Sequence 448 AA; Presentlin-2 M239V mutation.

                                                                                                                                useful
regions. Mutations in PS genes are implicated in familial Alzheimer's disease (AD) and possibly other diseases such as cerebral haemorrhage, schizophrenia, depression etc., so detection of mutations in the DNA encoding the wild type sequences can be used for diagnosis of these diseases. The wild type proteins, or vectors that express them or containing antisense sequences, antibodies selective for these mutant forms of the proteins and modulators of PS gene expression are potentially useful for treatment of AD etc. Transgenic animals are usef as models for drug screening. The antibodies can also be used e.g. for Sequence 448 AA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               360

9
coding sequence for wild type human PS-2. The presentlins are a family of highly conserved integral membrane proteins with a common structural nortif, common alternate splicing patterns, and common mutational hot spot regions. Mutations in PS genes are implicated in familial Albheimer's disease (AD) and possibly other diseases such as cerebral haemorrhage, schizophrenia, depression etc., so detection of mutations in the DNA encoding these sequences can be used for diagnosis of these diseases. These proteins, or vectors that express them or containing antisease sequences, antibodies selective for mutant forms of these proteins (such as W05736) and modulators of PS gene expression are potentially useful for treatment of AD etc. Transgenic animals are useful as models for drug screening. The antibodies can also be used e.g. for affinity purification
                                                                                                                                                                                                                                                                                                                                                                                            248

disease and for drug screening, drughosts and therapy of nightering bisclosure; Page 199-200; 238pp; English.

This polypeptide comprises the murine presentlin-1 (PS1) homologue. Its amino acid sequence was deduced from an isolated cDNA clone (see V04668). Mutations in the human PS1 and PS2 genes (see V04666-68) have been linked to the development in humans of forms of familial Alzheimer's disease (FAD). All amino acids that are mutated in analysed FAD pedigrees (see W2364) were conserved in the murine homologue. Use of the nucleic acids and proteins comprising or derived from presentlins can be made in screening and diagnosing FAD, identifying and developing therapeutics for treatment of FAD, and in producing cell lines and transgenic animals useful as models of FAD. Methods for identifying
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New isolated mutant presention-1 genes - useful for developing products for use in detection, diagnosis and therapy of Alzheimer's

peptides. Antisense nucleic acid may also be used to regulate expression of the PS1/429 gene, and both nucleic acids and peptides are useful as size markers in electrophoresis, chromatography etc. The transgenic animals are used as models for Ab. e.g. for testing drugs. Regulators of the PS1/429 gene or polypeptide can be used to treat e.g. Ab or diseases involving mitochondrial pathology, apoptosis and neurodegeneration. Typical regulators are antisense sequences, ribozymes, aptamers, synthetic or natural compounds. (II) may also be used to target other coding sequences to particular cellular locations.
                                                                                                                                                                                                                                                                                                                241

Patent No. 5840540
GENERAL INFORMATION:
APPLICANT: ROWGENS, JOHANNA M
APPLICANT: RASER, PAUL E
TITLE OF INVENTION: TO ALZHEIMER'S DISEASE
NUMBER OF SEQUENCES: 183
CORRESPONDENCESS:
ADDRESSEE: TESTA, HURWITZ & THIBEAULT
STREE: High Street Tower - 125 High Street
CONTY: Boston
STATE: Massachusetts
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ó
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      100.0%; Score 2336; DB 2; Length 448; 100.0%; Pred. A,Title: Mutation of a putative sperm membrane protein in Caenorhabditis elegans prev A;Reference number: A43459; MUID:92407040
A;Reference number: A43459
A;Accession: A43459
A;Status: preliminary; not compared with conceptual translation
A;Molecule type: DNA; mRNA
A;Residues: 1-465 <LHE>
A;Cross-references: EMBL:214067; NID:96868; PID:96869; EMBL:214066; NID:96870; PID:96
A;Experimental source: strain Bristol N2
A;Note: the nucleotide sequence was submitted to the EMBL Data Library, July 1992

-!- FUNCTION: MAY FACILITATE LIN-12 MEDIATED RECEPTION OF
INTERCELLULAR SIGNALS. IT MIGHT BE DIRECTLY INVOLVED IN LIN-12
MEDIATED RECEPTION, FUNCTIONING AS A CO-RECEPTOR OR AS A
DOWNSTREAM EFFECTOR THAT IS ACTIVATED UPON LIN-12 ACTIVATION.
ALTERNATIVELY IT MAY BE INVOLVED IN A MORE GENERAL CELLULAR
PROCESS SUCH AS RECEPTOR.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  204 LLLTVWNFGAVGMYCIHWKGPLVLQQAYLIMISALMALVFIKYLPEWSAWYLLGAISVYD
